

## **“Greening on Green Architecture from Designer’s Perspective”**

by **Ms Lilian Yu**

Senior Landscape Architect, Architectural Branch, Architectural Services Department

### Synopsis:

With the increasing urbanization and problems associated with global warming, people progressively recognize the potentials of greening for quality life. Since the last decade, Green Roofs have captured wide attention of professionals as well as general public in many countries.

Recently, other greening concepts such as Vertical Greening are emerging at both micro and macro levels. Experience will be shared on Architectural Services Department’s building projects, in which the two main categories of Green Roofs and different types of Vertical Greenings were implemented in a holistic approach to integrating architecture and greening elements at planning, design and construction stages.
