Project Vision

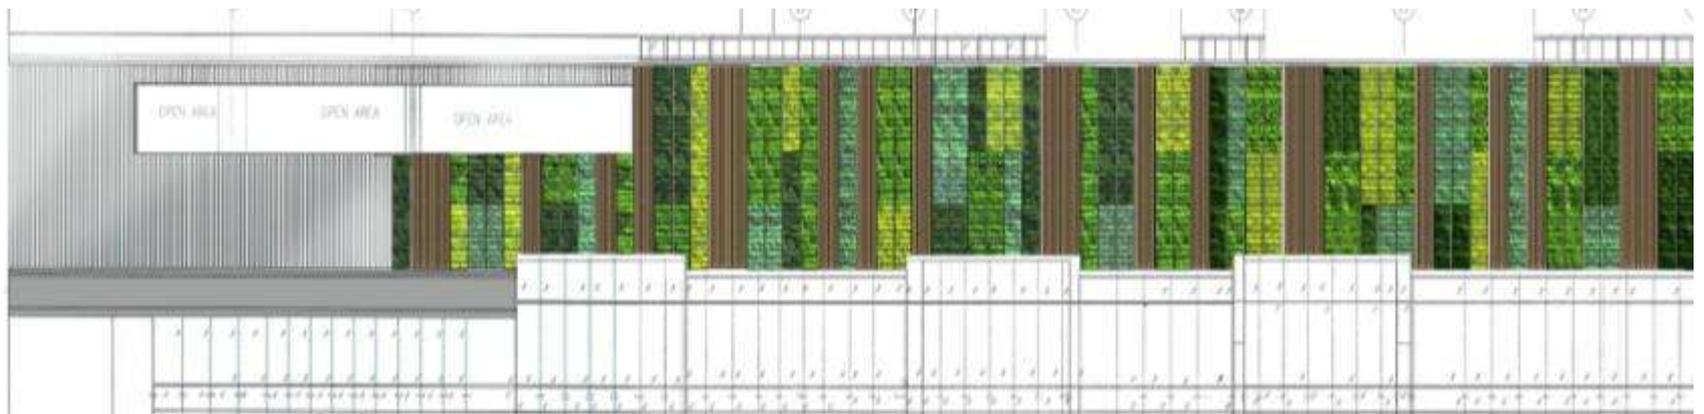

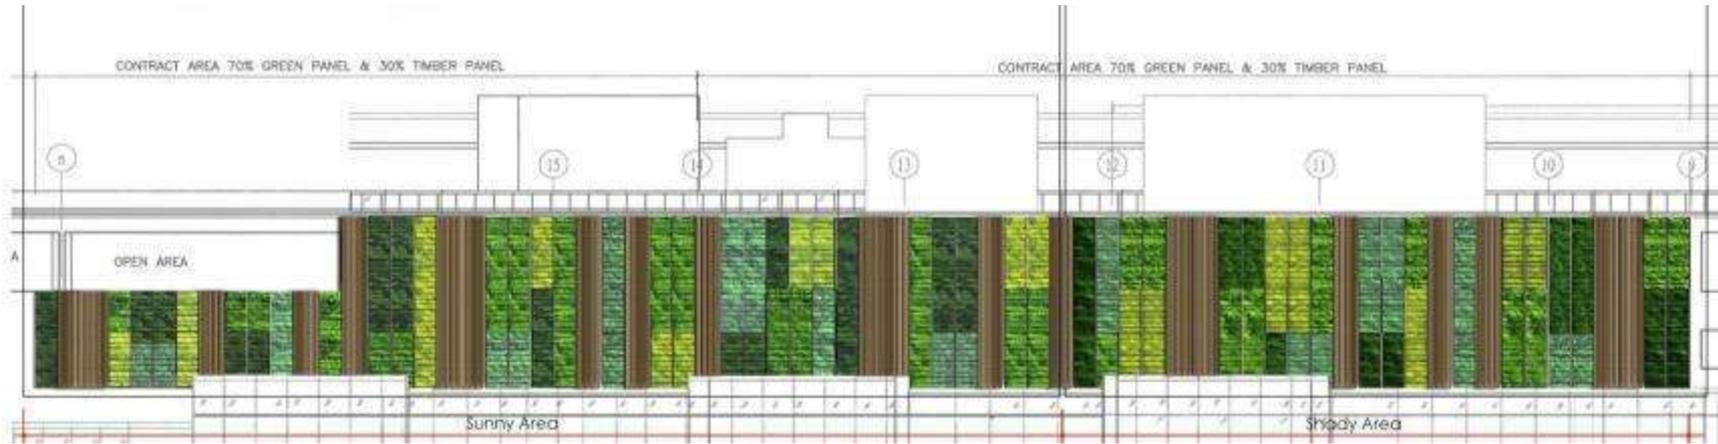

considerations

- orientation
- aspects
- height & size
- site constraints

prefabricated lightweight façade system

Design concept

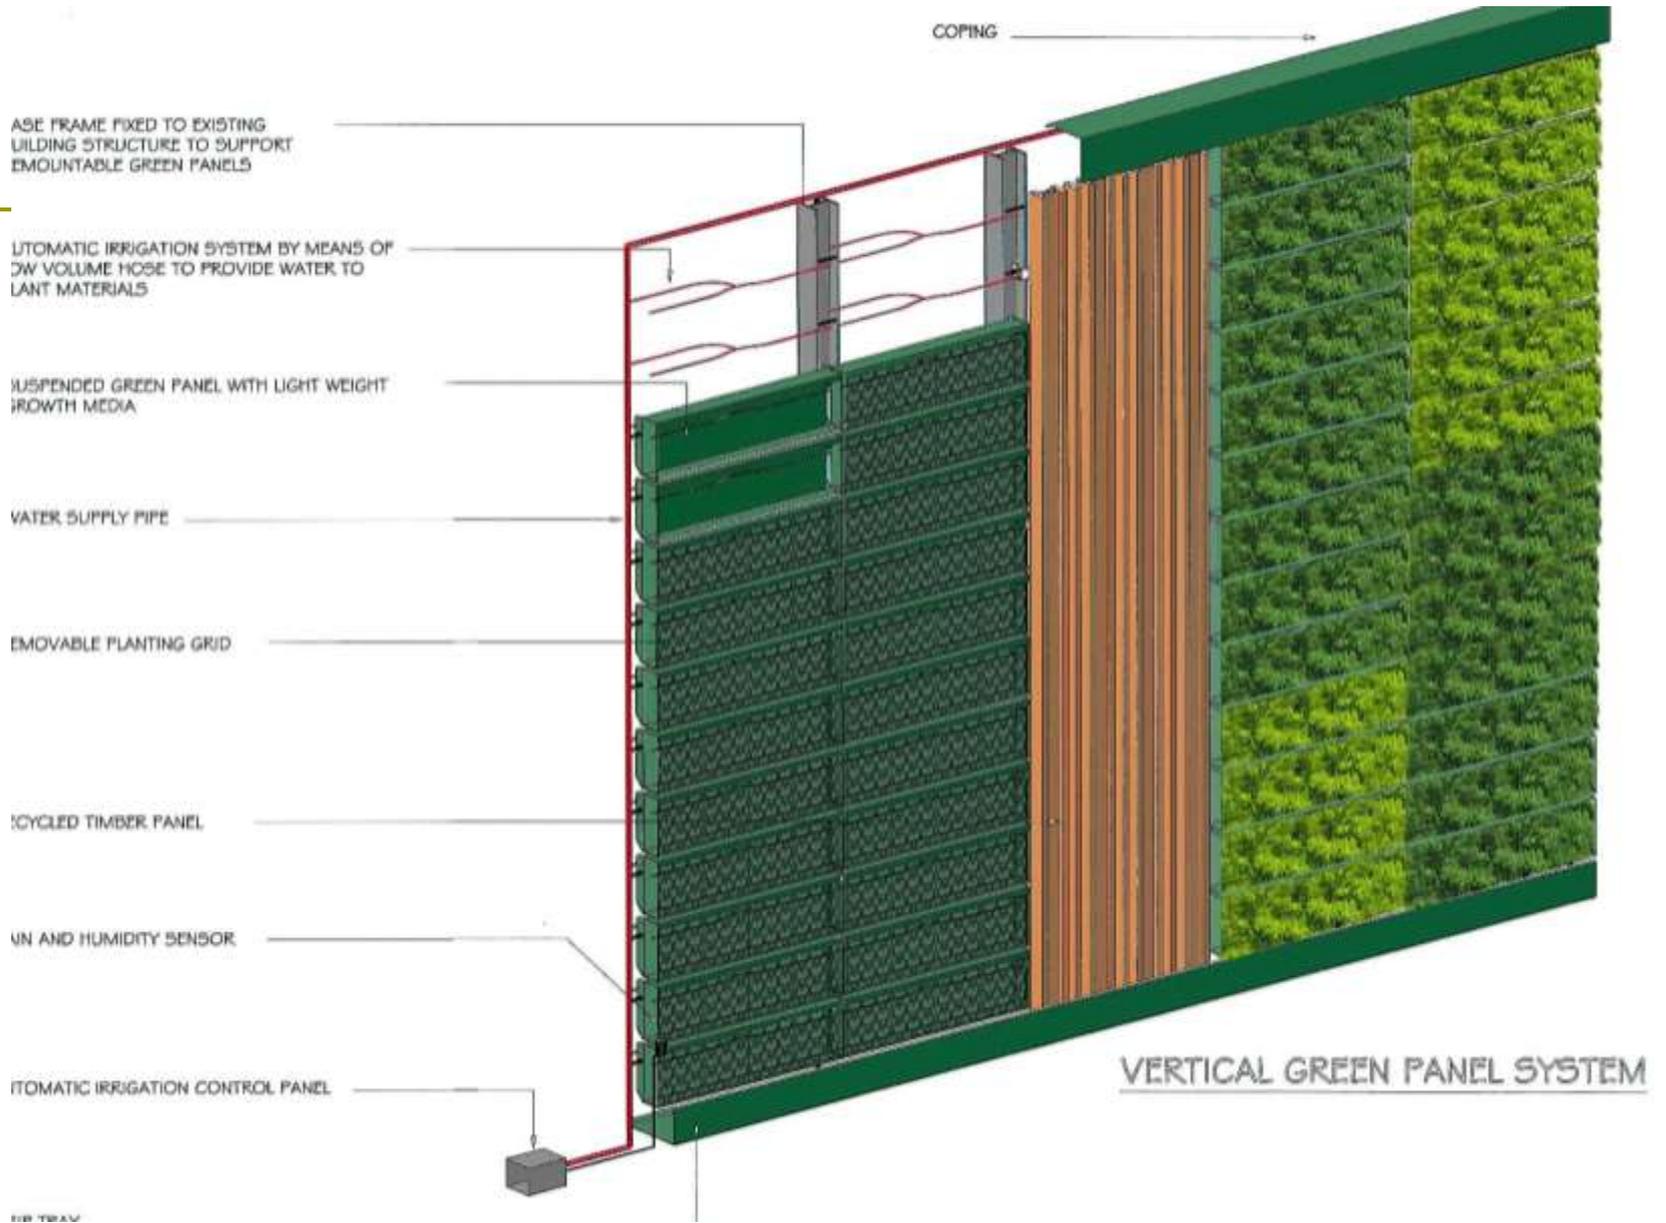

Integrated system

Elevation study

Structure . Irrigation . panel

Mock up & testing

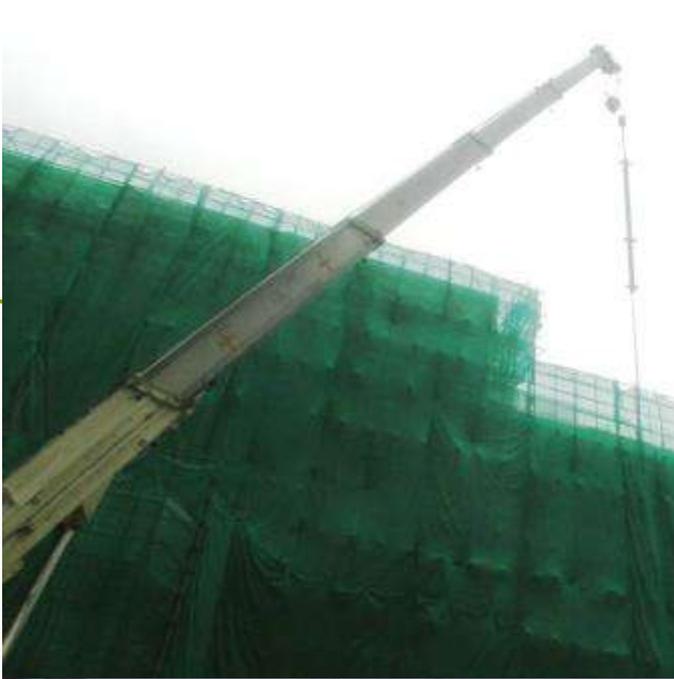

support frame . panel installation . growth medium . planting palette

On site installation

Work sequence

- Scaffolding
- Leveling
- Bracket installation
- sub frame

Work sequence

- green panels
- soil grid
- plant preparation
- irrigation system
- grid installation

Facts of greenwall

- Area • 700 sq.m
- Max height • 17.5m
- Green panels • 1,090
- Plants • 39,600
- Installation • 6 months
- Irrigation zones • 26
- Watering time • 2 hrs

Work sequence

Completion : 8 / 2007

CITYWALK 1

Multiple levels of garden

Public open space at G/F

Living walls help solve air quality problems. In a recent study, the management team at West City Group is providing their plans to build a more green and sustainable lifestyle and environment at Times City. From 2007, they intend reconstructing various streets.

That led them to design, develop and launch living walls. "Living walls" are a vertical structure of natural greenery, such as a wall-mounted and a pipe or other means of water delivery, in a vertical and horizontal plane. It consists of a living plant layer growing. The space helps and is suitable for various concepts in urban construction.

The design of living walls is designed to be a green and sustainable way of building parks. said Raymond Chen, vice president of living walls for green city group. The goal of the technology is to provide a green living wall.

Living walls are built around a concrete structure. They are made of a special material that can be used for indoor and outdoor planting. The light and water can be provided through a special system. The living walls are made of a special material that can be used for indoor and outdoor planting.

LIVING WALL
